Forecast horizon (days)

30

Selected model: Previous-Day Seasonal Naive (24h)

 PJM Hourly Energy Consumption Forecast

P-702 Forecasting Project

This application provides a 30-day hourly electricity-consumption forecast using the **Previous-Day Seasonal Naive (24h)** approach selected from the five-model comparison.

1. Dataset Overview

Observations	Start	End	Average Load
143,232	2002-04-01	2018-08-03	5,602.21 ...

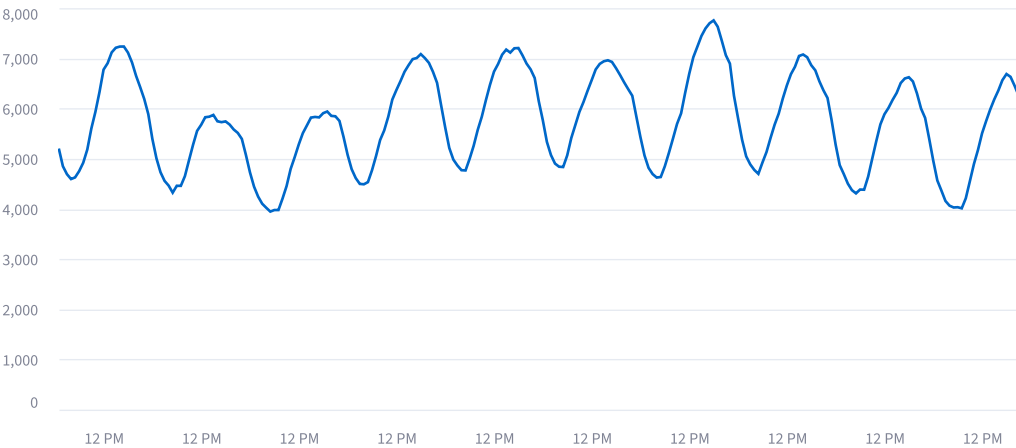

Duplicate timestamps handled: 4 | Missing hourly observations filled: 30

2. Selected Forecasting Model

Previous-Day Seasonal Naive (24h) — selected because it achieved the lowest test-set MAE, RMSE and MAPE in the five-model comparison.

Model	MAE	RMSE
Previous-Day Seasonal Naive		382.672
Previous-Week Seasonal Naive		612.047
XGBoost		624.689
HistGradientBoosting		661.409
Random Forest		709.236

3. Historical Consumption

Generate Forecast

Provide the dataset using the sidebar if required, choose the forecast horizon, and click **Generate Forecast**.
